

L-TRACK 2.0 TRACKING SOFTWARE FOR APLICOM L-SERIES

Aplicom L-Track 2.0 is an improved version of the ready-made tracking software for Aplicom L-series vehicle units. It allows using L-series as an integral vehicle-end part of a tracking or telematics system, with only the development of data reception and conversion to the back-end system. Fully configurable Event-Action -based functionality allows flexible use of the software in different applications such as fleet monitoring and route planning, rental car tracking, emergency positioning and anti-theft systems.

New GPRS-based over-the-air (OTA) updates introduced in version 2.0 allow Aplicom L-series units with L-Track software to automatically download configurations and software updates from a web server, saving maintenance time and cost. Improved L-Track configuration tool makes it even easier to set up a system utilizing Aplicom L-series units with L-Track 2.0 software. Several smaller improvements have also been made to the software to further enhance the user experience.

Aplicom L-Track 2.0 is available today and can be ordered factory installed on L-series units with GPS.
